Diabetes: Information for teachers

What is diabetes?
Diabetes is a metabolic disorder that affects the body’s ability to balance blood glucose (sugar), which is raised by certain foods, especially carbohydrates (carbs). Diabetes is not contagious and is not caused by eating too much sugar.

What do I need to know?

Insulin and carbs
Children who have diabetes are almost always treated with insulin. This means they need to take insulin anytime they have a snack or meal that contains carbs. The amount of insulin they need depends on the amount of carbs they eat and their sensitivity to insulin.

Children usually receive insulin by injection or with a pump. A student who has type 1 diabetes cannot be treated with pills.

Hypoglycemia
Hypoglycemia [hy-poh-gly-SEE-mee-uh] is the medical term for low blood glucose. Hypoglycemia can be dangerous for anyone with diabetes.

Hypoglycemia is most likely to occur:
• If the student misses or does not finish a meal or snack, especially after taking insulin
• During or after physical activity

Common signs and symptoms are:
• Sleepiness
• Sweating
• Confusion
• Pale skin
• Crying
• Moodiness or combativeness
• Grumpiness
• Headaches
• Shakiness
• Sudden hunger
• Lack of concentration
• Feeling “weird”

What do I need to know about hypoglycemia?

Hypoglycemia should be treated immediately. If a meter is not available and the child has symptoms, notify the office. A child with hypoglycemia should not be left alone or sent to the office by themselves. If a blood glucose meter is available, check your student’s blood glucose level. If it is below 80mg/dL, treat according to the instructions below.

1. Give 15 grams (g) of rapid-acting carbs. For example:
   – ½ cup juice or regular soda (not diet)
   – 1 fruit roll-up or a small package of fruit snacks
   – 3 to 4 glucose tablets, or 1 tube of glucose gel
   – 1 cup skim or low-fat milk

   Wait 15 minutes for the treatment to work and then check the student’s blood glucose levels.

2. If the student’s blood glucose remains below 80 mg/dL after eating 15 g of carbs:
   – Have the student eat another 15 g of carbs.
   – Check their blood glucose again in 15 minutes.

   If it’s still below 80 mg/dL, give 30 g of carbs and call their parents or healthcare provider. Make sure someone stays with the student during this time.

3. If the student’s blood glucose is between 80 mg/dL and 100 mg/dL and it will be 30 minutes or more before the next meal or snack, give another small snack with 15 grams of carbs and some protein. Check again in 1 hour.

4. Learn how and when to use an emergency glucagon/glucagen kit.
Nutrition at school

Students who are insulin-dependent must count the carbs in their food.

- Provide meal and snack menus for students and their families. These should include carb counts so insulin doses can be calculated correctly.
- If food is given during class times, the student may need to give insulin to cover the carbs.

Hyperglycemia

Hyperglycemia [hy-per-gly-SEE-mee-uh] is the medical term for high blood glucose. It can be caused by:
- Illness
- Missing an insulin dose
- Eating too much
- Stress

Common signs and symptoms of hyperglycemia are:
- Thirst (drinking more than usual)
- Urinating (peeing) more than usual
- Lack of concentration

Hyperglycemia is not a medical emergency.

What should I do?

- Allow the student unlimited access to water and the restroom.
- If symptoms persist, or if the student’s blood glucose meter reading is above 300 mg / dL, follow the instructions on the student’s diabetes medical management order (DMMO).
- Notify the student’s parents.
