Anterior Vaginal Wall Repair Surgery: Home instructions

Recovery is different for every woman and has a lot to do with the type of surgery you've had. It can last anywhere from 3 to 8 weeks. Be sure to follow your own care team’s specific instructions if different from what you see here.

Expect vaginal discharge

After an anterior vaginal wall repair surgery, it’s normal to have light vaginal discharge for up to 6 weeks. At first, the discharge tends to be bright red or pink. Gradually, it changes to a brownish or yellowish color. Here’s what to do:

- **Use pads to absorb discharge.** Change them every time you go to the bathroom.
- **Don’t use a douche, tampons, or have sex** until your healthcare provider says it’s okay to do so.
- **Wipe front to back after going to the bathroom** to prevent infection.

Manage pain and constipation

Take your pain medicine EXACTLY as prescribed. This will help to prevent addiction or accidental overdose.

Cramps, a bloated belly, and low back pain are all common complaints. Your pain and soreness should gradually go away as the days pass. However, pain medicine can cause constipation after surgery, which can cause discomfort. To prevent and relieve constipation:

- **Drink at least 6 to 8 glasses of water each day.**
- **Eat high-fiber foods.** Fresh fruit, vegetables, and whole grain bread are good options.
- **Don’t strain during bowel movements and do not use an enema.** Take a stool softener or mild laxative if your doctor recommends it.

Be alert to any signs of infection

You don’t need to care for the incisions (cuts) made in your vagina during surgery. The internal stitches will dissolve on their own. However, you must be alert to any of these signs of infection:

- **Fever of 100.4°F (38.0°C) or greater.**
- **Flu-like symptoms,** such as chills, body aches, fatigue (tiredness), or headache.
- **Increase in pain,** or pain medicine that isn’t working.

**What do I need to do next?**

1. Arrange to take some time off work—at least 2 weeks. This will give your body the time it needs to heal.
2. Ask a friend or family member to help with daily chores, such as cooking, cleaning, and yard work, for the first 2 weeks after your surgery.
3. Talk with your partner about sex and when you can be active again.
4. Know who to call with self-care questions:
   - Care provider: ________________
   - Phone: ________________
   - Location: ________________
Increase physical activity slowly
During your recovery, light activity is good for you. It helps prevent problems such as gas, stiffness, weakness, and blood clots. The trick is being active at the right level. Here are a few guidelines:

• **Take it easy for the first 2 weeks.** This means:
  - Don’t sit or stand for more than half an hour at a time.
  - Take short walks several times a day. Ask someone to go with you at first and if you feel shaky or dizzy. Start with short distances, and work up to longer walks.
  - Don’t push, pull, or strain.
  - Don’t lift anything heavier than 5 pounds. When you’re picking things up, bend carefully at the knees and lift slowly.
  - Don’t do housework or yard work. Ask friends or family to pitch in, or hire help.
  - You can drive as soon as your pain is gone and you are NOT taking any opioid pain medicine.

• **Avoid climbing stairs if it hurts,** but climb them as soon as you can do so without pain.

• **Ask your healthcare provider when it’s okay to return to work or do more strenuous exercise.** Many patients can return to work within 2 weeks, depending on the type of surgery.

Manage gas
Many women have gas after surgery. To prevent or treat gas:

• **Walk more often or a little farther every day.**
• **Stay away from carbonated drinks — and don’t use a straw.** Drink warm drinks.
• **Lay on your left side, with your knees drawn up to your chest.** Or get on your knees and lean forward, placing your weight on your folded arms with your buttocks in the air.
• **When you have gas, gently press on your abdomen every hour,** following these steps:
  1. Take a few deep breaths. Blow out slowly.
  2. Place your hands below your navel with the fingertips touching.
  3. Take a deep breath and hold it for 5 counts.
  4. Breathe out slowly and completely through your mouth while pressing in and down on your abdomen.
  5. Move your hands a half inch and repeat steps 2 to 4 several times, working in a circle across your lower abdomen.

Bathe carefully
You may take a shower after the first 48 hours (2 days), but don’t soak in a bath, hot tub, or swimming pool. However, you may sit in a few inches of warm water (“sitz bath”).

When can I have sex?
Don’t have sex until your doctor says it’s okay. Tell your partner that it’s important to check with the doctor before having sex to protect your healing.

Manage your energy
You can expect to feel tired while your body is healing. To help, follow these tips:

• **Try to get at least 8 hours of sleep each night.** Rest off and on during the day.
• **Eat well-balanced, healthy meals.**
• **Let your family know what they can do to help** so that you get the rest you need.
Urination (peeing)

After surgery, you might have trouble urinating (peeing). This might be due to your surgery. But it may also come from pain medicine, discomfort, or anxiety. Here’s what to do:

• **Don’t strain or bear down while going to the bathroom.** This can damage the area of your recent surgery.

• **Urinate while sitting in a few inches of warm water.**

• **Don’t let your bladder get too full.** It’s easier if you urinate more often.

• **Do Kegel exercises to strengthen the muscles around your vagina, bowel, and bladder.** To start, tighten the muscles you use to stop the flow of urine. Hold for a count of 10, then relax the muscles slowly. Repeat several times a day, working up to 100 Kegels a day.

• **If you can’t urinate on your own before you leave the hospital, you may need to go home with a urinary catheter** (a small tube to drain urine from the bladder). Until you can urinate on your own, follow these instructions:
  
  – **If you go home with a catheter in place,** follow the nurse’s instructions for caring for the catheter and drainage bag. Do any exercises you’ve been taught. And make sure you know when and how the catheter will be removed.
  
  – **If you need to self-catheterize,** a nurse will teach you how before you leave the hospital. Be sure to self-catheterize as often as your nurse has told you to—usually every 3 to 4 hours during the day.

**When should I call my healthcare provider?**

Call your healthcare provider if:

• You have signs of infection, such as:
  
  – Ongoing red bleeding from your vagina. (It’s normal to have a small amount of bloody discharge—but not red bleeding.)
  
  – Discharge that becomes foul-smelling or heavier than a light menstrual period.
  
  – Fever of 100.4°F (38.0°C) or greater.
  
  – Flu-like symptoms, such as chills, body aches, fatigue, or headache.

• Your pain gets worse, or your pain medicine isn’t working.

• You have a lot of bloating or swelling in your abdomen.

• You have pain, redness, or swelling in one leg or in your groin.

• You become more tired (rather than less) each day, or you’re dizzy for more than a few seconds at a time.

• You can’t urinate or have ongoing difficulty urinating.

• Have problems with your catheter or with self-catheterizing.

• You have bloody, cloudy, or foul-smelling urine or burning, painful, or frequent urination.

• You can’t relieve your constipation.

**CALL 911 or get emergency treatment if:**

• You have chest pain, a cough (not from a cold), or trouble breathing.

• You have continuing or severe abdominal swelling or bloating.
