This care process model (CPM) is produced by Intermountain Healthcare’s Lower Respiratory Tract Infection Team, a workgroup of the Primary Care Clinical Program. The CPM provides best-practice recommendations for differential diagnosis and management of acute cough and bronchitis.

KEY POINTS

- **Diagnosis of acute bronchitis should be made only after ruling out other sources of cough** — including pneumonia, asthma, influenza, pertussis, and acute exacerbations of chronic bronchitis (AECB). The algorithm on pages 2 and 3 guides that evaluation and diagnostic process. Local infection surveillance programs such as Germ Watch can provide up-to-date information about communicable diseases that routinely affect our communities.

- **If acute bronchitis is the diagnosis, antibiotics are NOT the answer!** Despite ongoing evidence that antibiotics are NOT needed for acute bronchitis, latest data show that their use is actually increasing. SelectHealth rates rose from 70% in 2008 to nearly 75% in 2010 (see graph at right), which mirrors the national trend. Unnecessary antibiotic use increases risk for disease complications related to drug-resistance pathogens, and increases healthcare costs.

- **Withholding antibiotics has no significant effect on patient satisfaction or return visits.** Studies show that education efforts and the time a healthcare provider spends with the patient are the biggest determinants of patient satisfaction results. See the ACUTE BRONCHITIS TREATMENT RECOMMENDATIONS box in the algorithm inside for tips on communicating with patients about cough illnesses and antibiotic resistance.

WHAT’S NEW IN THIS UPDATE?

- New data showing an upward trend in unnecessary use of antibiotics for treatment of acute bronchitis — reinforcing our need to do better!

- Updated information on sinusitis, influenza, and pertussis testing and treatment, with links to more information.

- Summary of evidence base for symptom relief of acute cough (see ACUTE BRONCHITIS TREATMENT RECOMMENDATIONS box inside).

- New and revised provider and patient education materials to support physicians in differential diagnosis and evidence-based treatment of acute cough (bronchitis) and related illnesses.

GOALS

- Help providers improve accuracy of diagnosis of acute bronchitis and other lower respiratory tract infections.

- Reduce the unnecessary use of antibiotics for treatment of acute bronchitis, thereby sparing patients the additional risks and associated costs.

The inside pages of this tool provide an algorithm and associated notes, and can be folded open and posted in your office or clinic. The back page summarizes vaccine recommendations, references, and resources.
**Diagnosis and Management of Acute Cough (Bronchitis)**

- **Possible Pneumonia (b)?**
  - **YES** 
    - Chest x-ray
    - **POSITIVE**
      - See Intermountain’s Pneumonia CPM
      - Available on the Pneumonia topic page at intermountainphysician.org/clinicalprograms
  - **NEGATIVE**

- **Possible Asthma (c)?**
  - **YES**
    - See Intermountain’s Asthma CPM
      - Available on the Asthma topic page at intermountainphysician.org/clinicalprograms
  - **NO**

- **Possible Rhinosinusitis (d)?**
  - **YES**
    - **Treat with antibiotics only if signs and symptoms are persistent or severe (d1)**
    - **First-line antibiotic choice is amoxicillin 875 mg twice daily for 10 days (d2)**
      - For prior treatment failure, or penicillin allergy, use alternatives (d3)
  - **NO**

- **Possible Influenza (f)?**
  - **YES**
    - **Consider influenza testing (f2) and antiviral treatment (f3) for patients who are within 48 hours of symptom onset, especially those at risk for influenza complications**
    - **Provide symptom relief and patient education** (see ACUTE BRONCHITIS TREATMENT RECOMMENDATIONS below).
  - **NO**

---

**Acute Cough (Bronchitis) Symptoms:**
- **Acute bronchitis** is defined by the CDC as “an acute respiratory infection with a normal chest radiograph that is manifested by cough with or without phlegm production that lasts for up to 3 weeks.”
- **Possible Influenza:**
  - Fever 37.8°C (100°F) or greater
  - Heart rate 100 bpm or greater
  - Respiratory rate 24 or greater
  - Decreased breath sounds

**Possible Asthma:**
- History of recurrent wheezing and/or cough, especially at night
- History of allergic rhinitis or eczema
- Exertional dyspnea
- Variation of symptoms from day to day

**Rhinosinusitis:** Bacterial rhinosinusitis is likely if:
- Nasal purulence not improving after 7 days
- Unilateral facial or tooth pain or tenderness, or worsening after initial improvement

**First-line treatment:** amoxicillin 875 mg twice daily for 10 days

**Treatment alternatives:**
- If prior treatment failure, high-dose amoxicillin-clavulanate (two 1000 mg XR tablets twice daily, dose based on amoxicillin component) for 10 to 14 days
- If allergic to penicillin, cefdinir 600 mg once daily x 10 days

**Germ Watch** is a local infection surveillance program accessible from the intermountainphysician.org home page.

**Influenza** (www.cdc.gov/flu/professionals)
- **Symptoms:** Influenza is likely if:
  - Sudden fever over 102°F / 39°C with a cough, sore throat, or other respiratory symptoms
  - In flu season
- **Testing:** Consider influenza testing in these cases:
  - If the results will change clinical care of the patient (e.g., use of antibiotics or antiviral medications, further diagnostic tests, homecare, etc.)
  - If the results will influence clinical practice for other patients (e.g., confirm influenza virus circulation in the community, etc.)
Possible PERTUSSIS (g)?

Yes

Possible AECB (acute exacerbation of chronic bronchitis) - (h)?

Yes

Diagnose as ACUTE BRONCHITIS (Chest Cold)

### ACUTE BRONCHITIS TREATMENT RECOMMENDATIONS

- **Withhold antibiotics.** Antibiotics are NOT routinely indicated for uncomplicated acute bronchitis, regardless of duration of cough.

- **Educate patients.** Tips for talking with patients:
  - Identify and validate patient concerns and spend time answering patients questions.
  - Refer to cough illness as a “chest cold” rather than bronchitis.
  - Explain how antibiotics increase the risk of antibiotic-resistance infections, which can be serious.
  - Provide information about expected duration of cough and offer a contingency plan if symptoms worsen. Recommend specific suggestions for symptom relief (see below).
  - Provide patient education materials to reinforce the above (at right).

- **Recommend symptom relief:**
  - **For fever, aches, and pains:** Nonsteroidal antiinflammatory and/or acetaminophen may help relieve aches and pains.
  - **For nasal congestion and other cold symptoms:** Nasal decongestants may be helpful for associated symptoms of common cold.
  - **For cough relief:** Unfortunately, evaluation of overall efficacy of acute cough remedies is difficult due to low quality of most clinical trials or trial results that varied significantly. See the table at right for a summary of study findings.
  - **Follow up:**
    - Have patient make a follow-up appoint for new or worsening symptoms, or if cough lasts for more than 3 weeks total (refer patient to tips on the Colds and Coughs fact sheets for when to call the doctor).
    - Re-evaluate; Consider chest x-ray.
    - Patients can still have bronchial hyperresponsiveness for 5-6 weeks. If cough lasts more than 3 weeks and less than 8 weeks, and chest x-ray is normal and pertussis has been ruled out, consider diagnosis of postinfectious cough. Antibiotics are still not indicated. Consider trial of ipratropium. If ipratropium is ineffective, and cough affects quality of life, consider inhaled corticosteroids.
  - **Encourage prevention:** Regular hand washing, vaccines (see back page), smoking cessation.

### Effectiveness of various acute cough remedies

- **Ipratropium 80 ug 4 times daily** may be effective
- **Itratropium 18 ug daily** may be effective
- **Guaifenesin 200 to 400 mg 4 times daily** may be effective
- **Beta 2 agonists (albuterol) may be effective if wheezing or asthma present; otherwise not effective**
- **Benzonatate** not more effective than placebo
- **Codeine** not more effective than placebo
- **1st generation antihistamines** inconsistent evidence on effectiveness
- **2nd generation antihistamines** not more effective than placebo
- **Zinc** not effective

### PERTUSSIS

1. **Signs and symptoms that may indicate pertussis:**
   - Cough lasting 2 to 3 weeks or longer, with characteristic “whoop” and/or coughing to the point of vomiting.

2. **Testing:**
   - **Send nasopharyngeal swab for PCR.** Despite a high false-positive rate, this is becoming the standard test in the outpatient setting since results are available within 2-3 days. OR
   - **Obtain a nasopharyngeal culture.** This has been considered the “gold standard,” but has a poor yield in the outpatient setting and takes 3 to 5 days for results.

3. **Treatment:**
   - Treat with a macrolide antibiotic and 5 days isolation

### AECB (acute exacerbation of chronic bronchitis)

- **Previous diagnosis of chronic bronchitis (productive cough present 3 months/year x 2 years) or COPD**
- **Increased dyspnea and cough**
- **Possible increased sputum volume or purulence**

### NOTE:

Keep in mind the limitations of influenza testing. During flu season, positive tests are reliable, but false-negative tests are more prevalent. Patients with severe respiratory symptoms or acute respiratory illness, who are at higher risk for influenza complications (e.g. chronic diseases, immunosuppression, etc.), should still be considered for antiviral treatment despite a negative rapid flu test, unless illness can be attributed to another cause.
Vaccine recommendations (cdc.gov/vaccines/hcp/acip-recs/index.html)

- **Influenza.** Annual influenza vaccine is recommended for all patients over 6 months of age, but is particularly important for the following patients who are at increased risk for severe complications:
  - All children aged 6 months to 4 years (59 months) and all adults >50 years
  - Children and adolescents receiving long-term aspirin therapy at risk for Reye’s syndrome
  - Women who will be pregnant during the influenza seasons
  - Adults and children with chronic pulmonary, CV, renal, hepatic, hematological, or metabolic disorders
  - Adults and children who have immunosuppression or any condition that can compromise respiratory function or the handling of respiratory secretions or that can increase the risk for aspiration

- **Pneumonia.** Pneumococcal vaccine is recommended for all patients 65 years old or older, as well as patients with serious long-term health problems and/or conditions that lower resistance to infections. All Alaskan Natives and certain Native American populations should also be vaccinated. Vaccination is generally good for life, but a single revaccination is recommended in the following cases:
  - At age 65 or older, second dose is recommended if patient received first dose >5 years previously and was aged <65 years at the time. If the first dose was given at age 65 or older, revaccination is not recommended.
  - For immunocompromised patients between ages 2 and 64, second dose is recommended 5 years after the initial dose.

- **Pertussis.** Tdap vaccine is recommended as follows:
  - For individuals ages 11–64 years in place of one booster dose of the tetanus and diphtheria toxoids (Td) vaccines to provide added protection against pertussis, along with protection against tetanus and diphtheria.
  - For pregnant women without updated pertussis vaccine during the late second trimester (after 20 weeks) or third trimester, rather than immediately after delivery.
  - For adults 65 years or older who have close contact with infants, or for anyone in this age group who desires the vaccines and has not previously received it.
  - For postexposure prophylaxis for all healthcare personnel who have contact with high-risk patients, regardless of vaccination status. Personnel who don’t have contact with high-risk patients can either receive postexposure prophylaxis or be monitored for 21 days after pertussis exposure and treated at the first onset of symptoms.

Where to find resources (intermountainphysician.org)

**GermWatch:** Physician version is available from the home page of intermountainphysician.org. Patient/public version available from germwatch.org.

**Patient and Provider Education Materials:** Available at intermountainphysician.org/clinicalprograms (click Primary Care on the left, then Topics, then Bronchitis).

**Adult Acute Bronchitis Flash Card:** Also available on the Bronchitis topic page.

To order copies of materials, go to i-printstore.com.
